Type: ROUTINE INSPECTION
Date: 24-MAR-2026

2.31(e)(4) Critical

Institutional Animal Care and Use Committee (IACUC).

On February 5, 2026, two dogs were noted as being depressed and drooling and received veterinary treatment after the highest dose of a dose escalation study. The next morning, one female beagle (1459785) was found deceased, and a male beagle (1524022) was found lethargic and minimally responsive and subsequently euthanized. Earlier in the study after administration of a lower dose of the test article, the dogs on study experienced lethargy, drooling, regurgitation, and weight loss. The protocol did not address the minimal effects needed to meet the study's goals. In order for the IACUC to evaluate an animal use proposal and its impact on the welfare of the animals involved, the proposal must include a description of procedures designed to assure that discomfort and pain to animals will be limited to that which is unavoidable for the conduct of scientifically valuable research, including provision for the use of analgesic, anesthetic, and tranquilizing drugs where indicated and appropriate. To be corrected by May 27th, 2026.

This inspection and exit interview were conducted with the attending veterinarian and the IACUC chair.
