Rabbit Health Report Totals: October 2013 through January 2026

Representative animals are submitted alive to a reputable diagnostic laboratory for a complete health assessment which includes a complete physical examination, complete gross necropsy, pelt examination, fecal and cecal content examination, and histopathology of select organs (liver, kidney, lung, ileum). Samples (culture and MALDI-TOF) are taken of nasal/oropharynx aspirates, bronchial washes, and cecum to detect bacteria (e.g. Pasteurella, Bordetella, Salmonella, etc.). Serology samples are submitted for Treponema cuniculi, CARBacillus, Encephalitozoon cuniculi, C. piliforme and Toxoplasma gondii. Multiplex PCR is performed to detect RHDV. PCR to detect Pasteurella spp and Clostridium piliforme is utilized based on suspect serology, culture, histopathology or herd health findings.
